

# blue wish®

The first cleaning cloth that doesn't smell!

A 3000-year-old success story continues: In ancient times silver was used to disinfect water supplies. Furthermore, our grandparents added a silver coin to their milk to keep it fresh longer.

The effectiveness of silver is based on the release of so called ions, electrically charged positive elementary particles. The release of silver ions occurs only under wet conditions. These ions prevent the reproduction of bacteria in a natural way by blocking their energy production, i.e. microorganisms «starve» in a manner of speaking.

Since no bacteria can develop with bluewish, there is no decomposition process and there are no unpleasant smells. bluewish doesn't smell. This proves the antibacterial effectiveness of silver ions. Merging smartcel bioactive and modal microfiber attests bluewish the unique combination of high suction power and antibacterial effectiveness.

## Tested quality

The «Research Institute Hohenstein» tested the antibacterial effectiveness of bluewish. Compared to a conventional polyester cloth, 99% less bacteria was found on a bluewish cloth after 18 hours.

## Composition:

80 % cellulose / 15 % P.P. / 5 % smartcel™ bioactive, not chemically stabilized.

After the first wash cycle bluewish obtains its cellulose structure and natural form.

Care: U G H p

- The first cleaning cloth that doesn't smell!

- 5 cleaning cloths, 30 cm x 38 cm
- 99% less germs and bacteria, antibacterial
- odor-free and bioactive
